# Australia's undercover mineral potential

# Government response

## VISION:

Unlocking Australia's hidden resource potential.

## MISSION:

To address greenfield exploration challenges, stimulate new discoveries, ensure continuity of the pipeline of mineral resource investments, and the longevity of Australia's mineral resources industry.

## SCOPE OF THE STRATEGY

This National Mineral Exploration Strategy focuses on the acquisition and delivery of pre-competitive geoscience, applied geoscience research initiatives to assist exploring undercover and a mineral exploration investment attraction plan. Supporting activities associated with the strategy aimed at cross-jurisdictional collaboration on regulatory reform are also underway. The strategy will not address the financial challenges facing the minerals sector.

THE THREE ELEMENTS OF THE NATIONAL MINERAL EXPLORATION STRATEGY ARE:

PRE-COMPETITIVE  
GEOSCIENCE INFORMATION

MINERAL EXPLORATION  
INVESTMENT ATTRACTION PLAN

NATIONAL GEOSCIENCE  
RESEARCH INITIATIVE

....and the Exploration Development Incentive (EDI)

# Continuing to build on national maps

Precompetitive data program with collaborative projects with States/NT geological surveys:

- airborne magnetic-radiometric
- gravity
- AEM
- Seismic/MT transects
- AusLAMP
- Regional drilling (Thomson)
- Geochronology and stratigraphy

Greenfields focus of combined Gov efforts

# Australia's exploration challenge and the opportunity

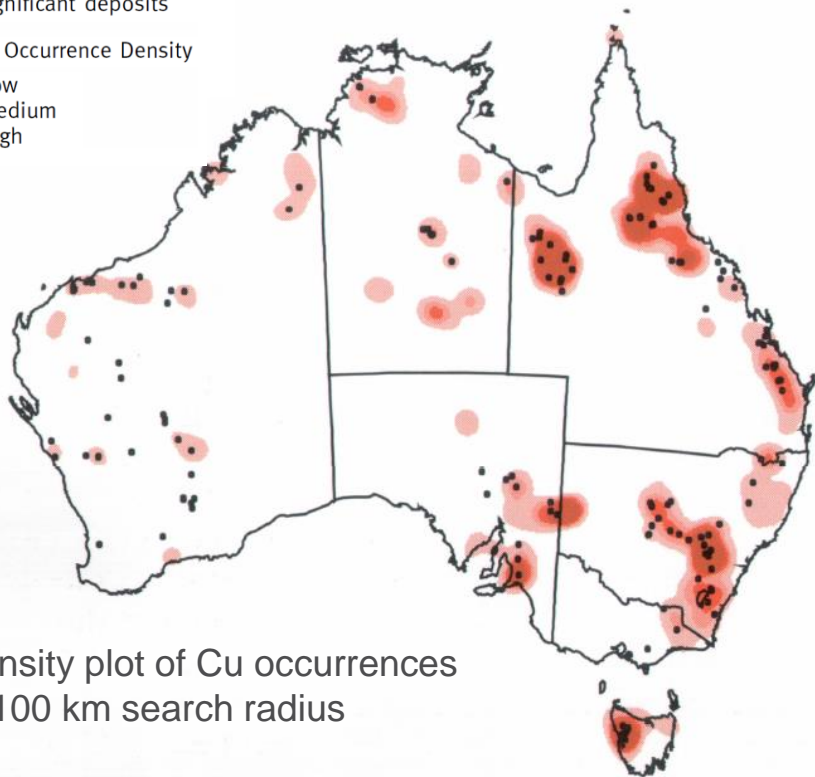

- Continent is ~80% covered
- How to more effectivity and efficiently explore through cover?
- **Need to be predictive – take an integrated systems view ....**

# Data-driven or empirical approach: Cu

● Significant deposits

Mineral Occurrence Density

Density plot of Cu occurrences  
in 100 km search radius

- Density plots analysis of known occurrences
  - Identifies historic mineral provinces
- Most anomalously high distributions have 1 or more Tier 1 deposits (dots)
  - Some exceptions
- Results strongly driven by surface prospecting
- Substantial potential undercover extensions and greenfields areas

Jacques et al., 2001: AGSO Research Newsletter 34.

# Mineral Systems: a powerful method of prediction

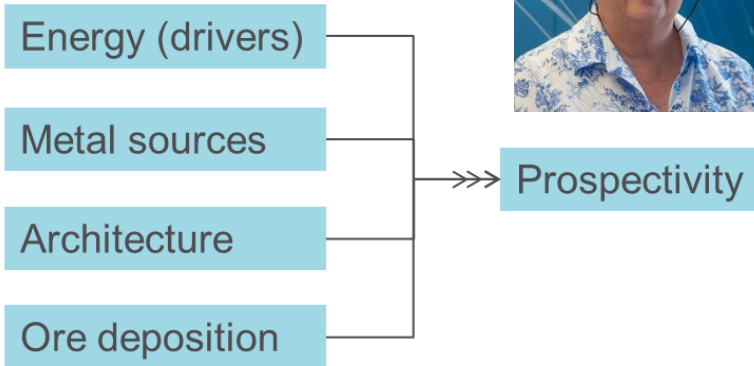

Figure 3 The mineral systems concept of ore-body formation.

A mineral system is defined as ALL the geological components that control the generation and preservation of mineral deposits  
Wyborn et al., (1994)

# Tectonic framework for mineral systems & ore genesis

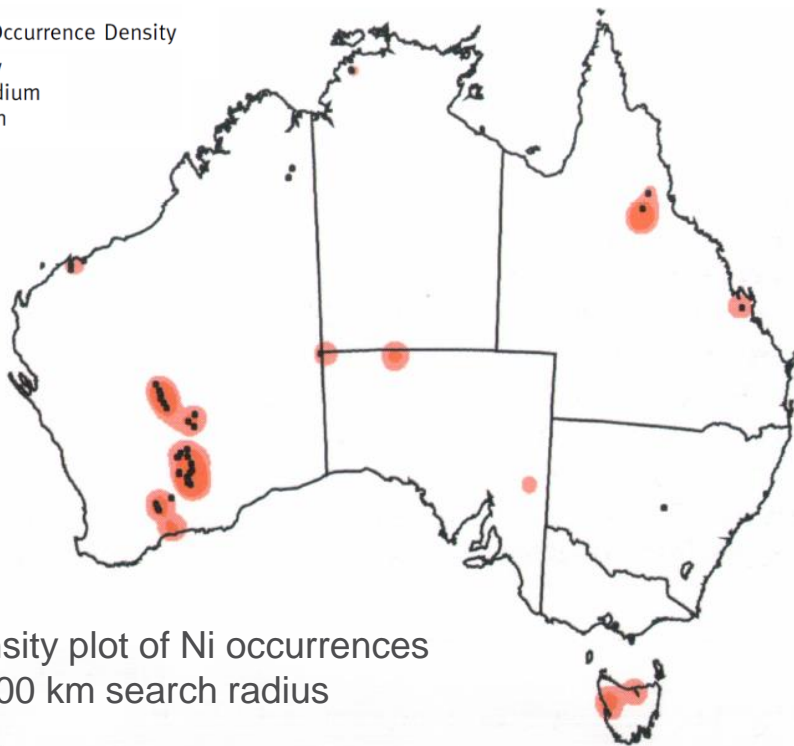

Hundreds of km

# Data-driven or empirical approach: Ni

● Significant deposits

Mineral Occurrence Density

Density plot of Ni occurrences  
in 100 km search radius

- Density plots analysis of known occurrences
  - Identifies historic mineral provinces
- Most anomalously high distributions have 1 or more Tier 1 deposits (dots)
  - Some exceptions
- Results strongly driven by surface prospecting
- Substantial potential undercover extensions and greenfields areas

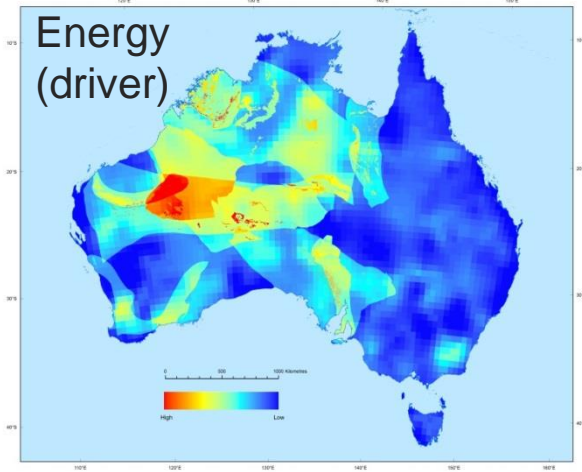

Jacques et al., 2001: AGSO Research Newsletter 34.

# Magmatic Ni-PGE potential of Australia

*Each of 4 components combines geophysical, geological, geochronological, geochemical data*

From: Dulfer, Skirrow, Champion, Czarnota et al. (in prep.)

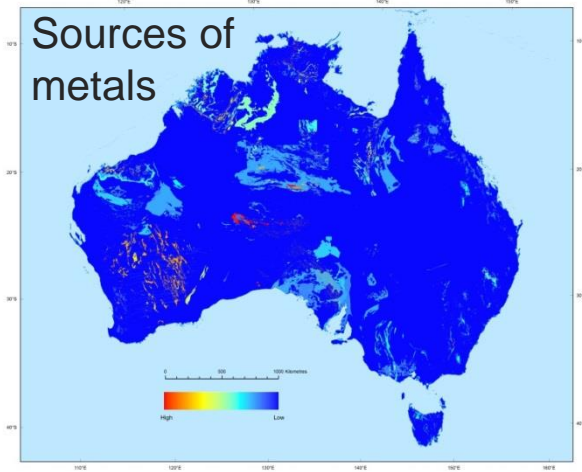

Energy (driver)

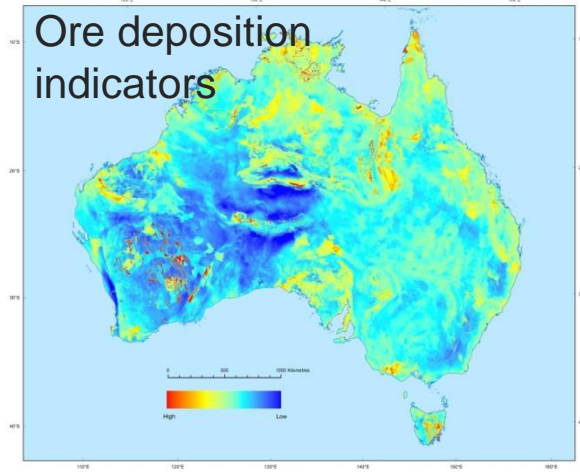

Architecture

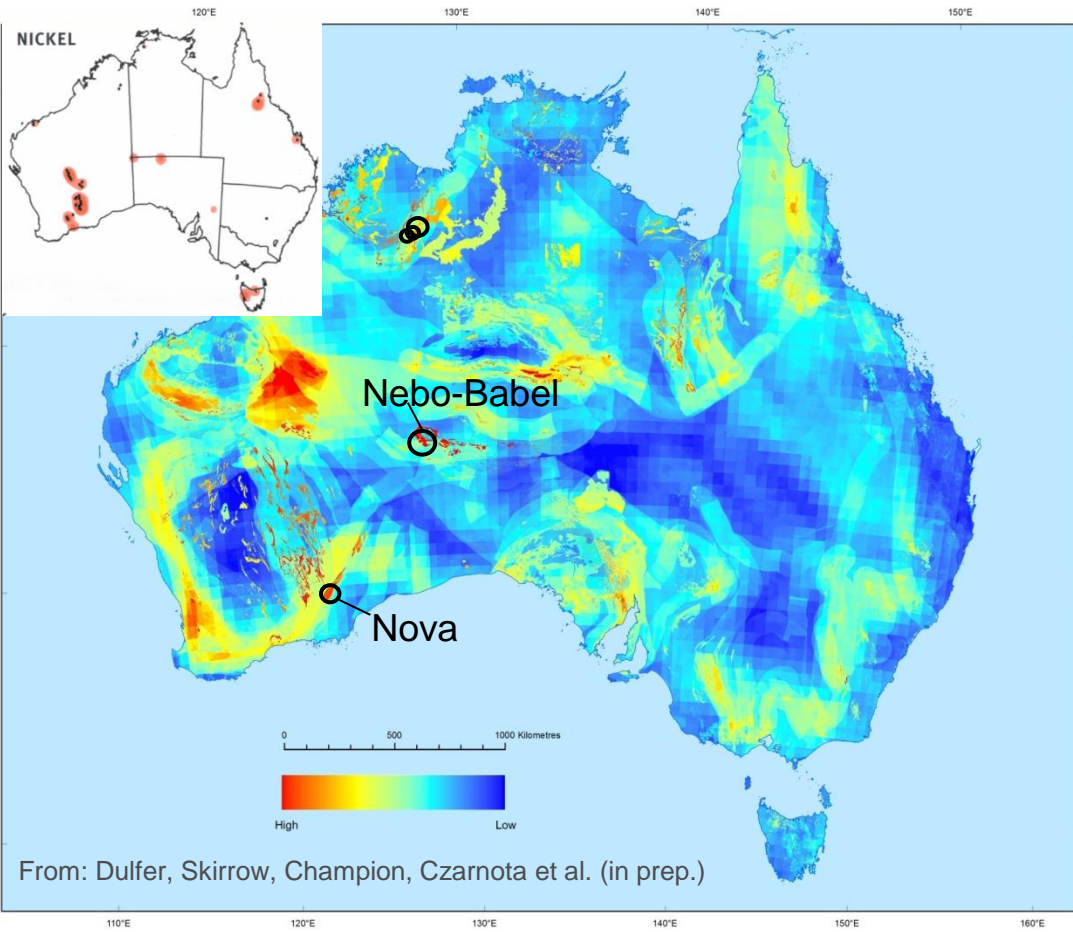

Sources of metals

Ore deposition indicators

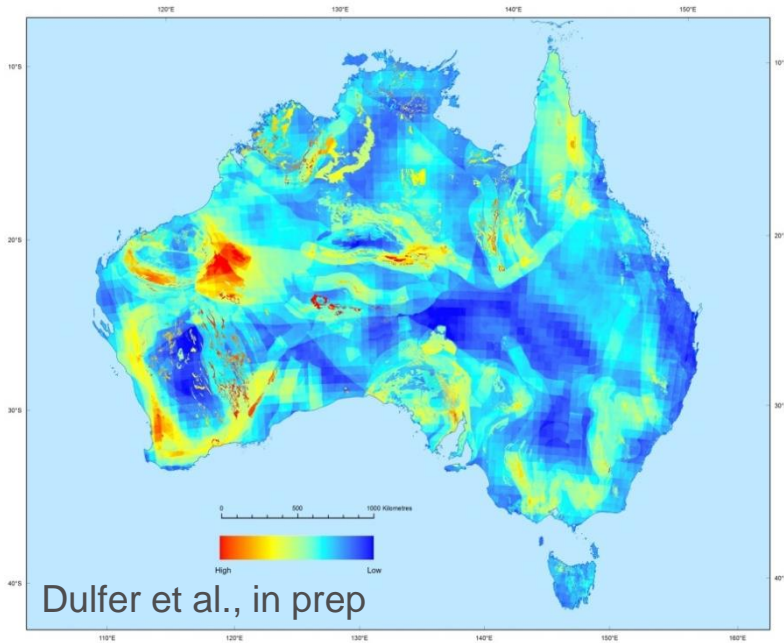

## Magmatic Ni-PGE potential of Australia:

- The first national assessment of its type
- Targeting Noril'sk (\$1t) and Voisey's Bay type deposits
- Predicts locations of major known deposits/districts
- Highlights many other areas for follow-up by industry (Victoria?)
- Predicts potential under cover

# PREDICT new greenfields provinces

National-scale: Ni-PGE potential

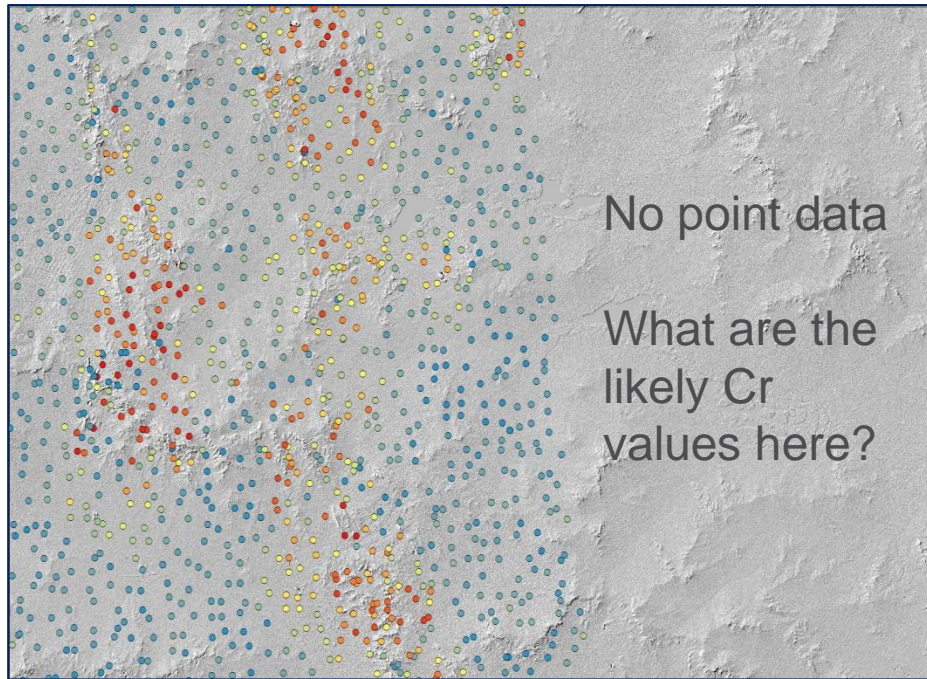

Regional-scale: Cu-Au potential

# Geochemical points to surface predictions: data mining

Regional regolith geochemistry program of GSWA – (Paul Morris)

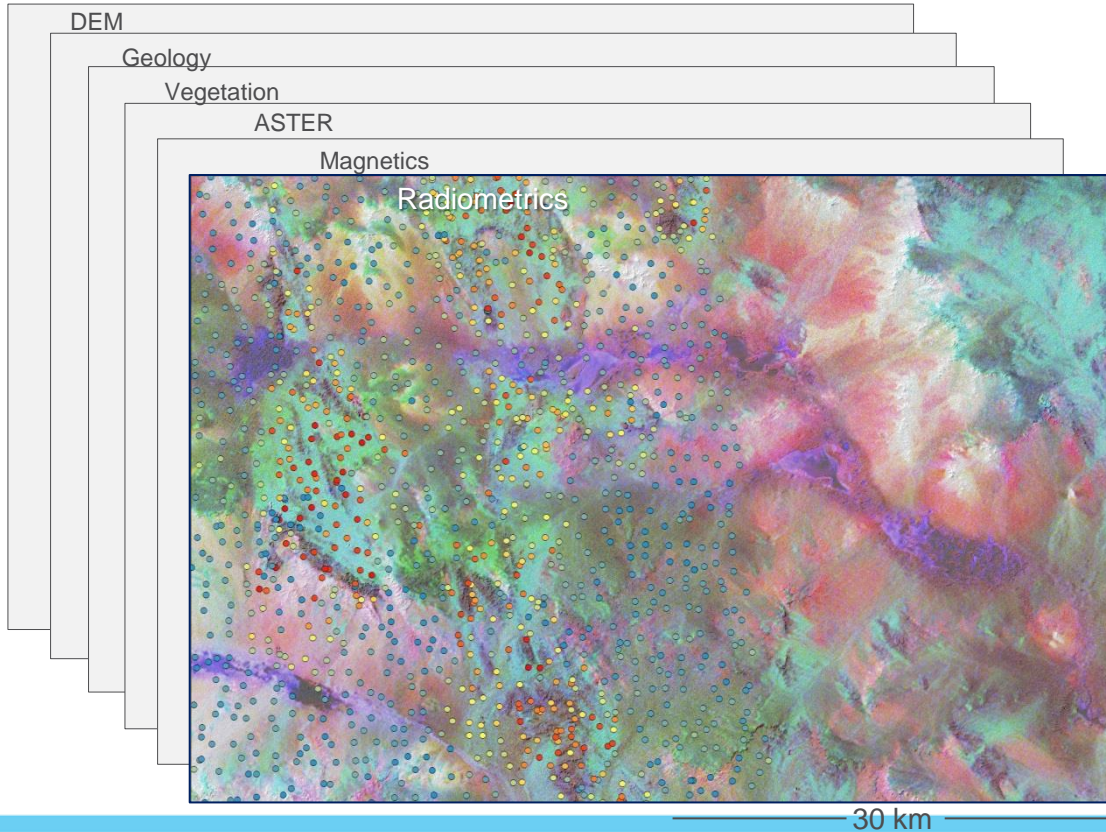

Cr ppm

- Extensive soil geochemistry databases in state/NT survey (eg. Leinster WA)
- How do you predict what is between samples and in regions distant from the grid?

30 km

# Geochemical points to surface predictions: data mining

- Chromium points on radiometrics grid
- uses radiometrics, DEM, geology, vegetation, ASTER, magnetics, gravity etc
- Cubist method uses open source R codes
- not interpolation between points but a model prediction based on environmental correlation

# Geochemical points to surface predictions: data mining

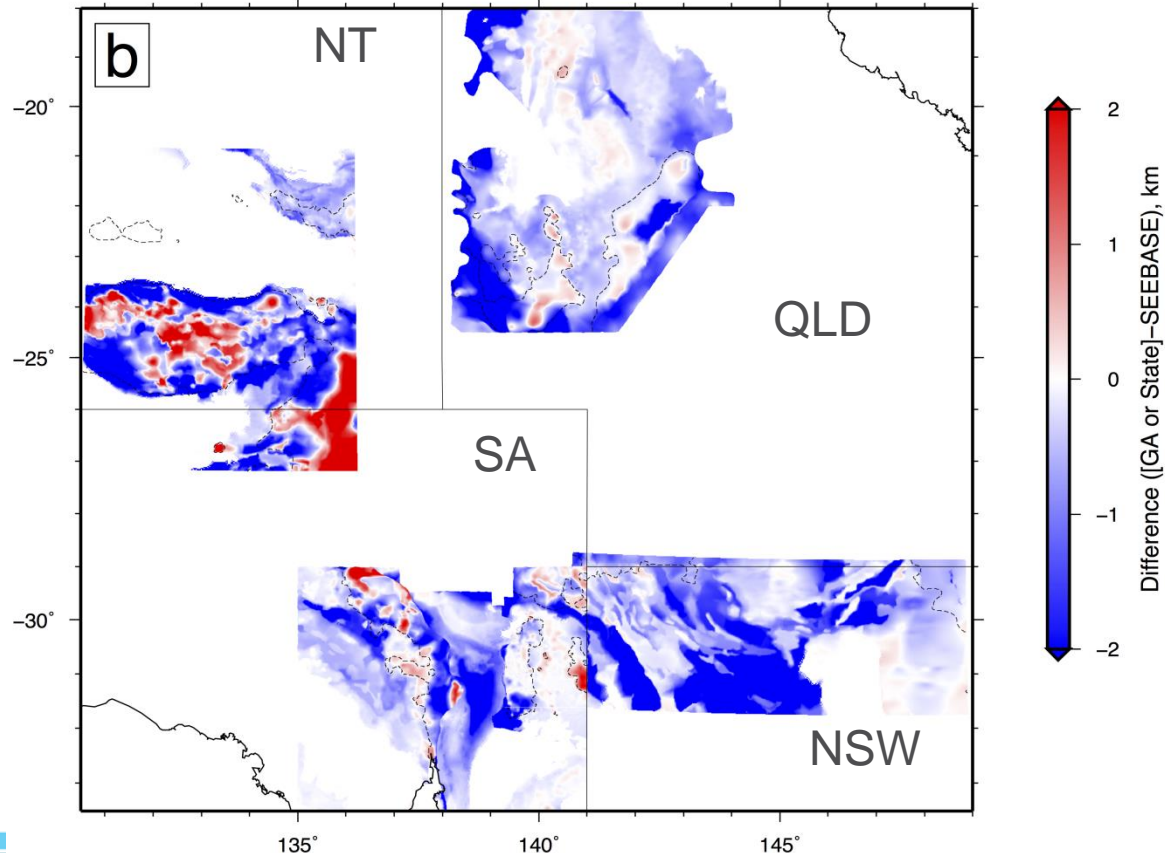

Geochemical sample locations coloured on Cr concentration  
Mafic outcrop = white polygons

- the method has generated a model prediction of Cr in the landscape
- The colours on the map are scaled the same as the Cr points
- out-of-sample cross validation  $R^2 = 0.71$
- method can be applied to any point data relationship with other covariates (e.g. cover thickness estimates)

# Mapping cover thickness: the science problem

- One person's cover is another person's basement
- Cover is just geology in 3D space plus time
- 'Cover' estimates difference map between GA and/or State maps and SeeBase as reference
- Lets go back to basics and deal with points

# Points to surfaces: predictions through data mining

Surface geol.

Topo. relief

Valley flatness index

Weathering intensity

RTP TMI

Cenozoic geology

Filtered tilt est.

DEM

Distance from outcrop

Bouguer gravity

Green line – outline Murray Basin

# Points to surfaces: predictions through data mining

# Conclusions

- Australia has excellent opportunities in the vast greenfield under cover regions
- We have prospective ground, good data, skilled & connected people
- Mineral exploration is a risk-based decision-making process of successive area and volume reduction
- To lower risk we need ways of working that fully utilise the data in a more predictive way
- We can do this with:
  - mineral systems science and its application to targeting science (eg Ni, Cu-Au)
  - data mining methods that integrate multidisciplinary datasets
  - methods that quantify uncertainty and preserve fundamental data
